 The invention relates to human polynuclectides (AAI79941-AAI91841) and the encoded proteins (AA000010-AA019910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokine, or other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                       Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    claim 20; SEQ ID NO 23550; 1399pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 61;

This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX84924) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 125 novel genes and their fragments (nucleic acid sequences: AAX84933-X85057; amino acid sequences AAX75567-X7933) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the expressed in (see AAX84933 for described uses)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formatirectly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #1634 encoded by probe for measuring placental gene expression.
                                   Human; foetal liver; gene expression; single exon nucleic acid probe.
Peptide #1640 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 27; SEQ ID NO 26769; 639pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                          Peptide #1576 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from which a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probes are useful for verifying the care useful for gene discovery, and for determining predisposition and/or proposing breast disease. Gene expression analysis is useful for sassessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring cases expression, with far less bias than expressed sequence tag microarrays. The method is suitable for repaid production of functional information from genomic sequence. The present sequence is a peptide ancomic acid probe of the invention. Note: The sequence date for this patent did not form part of the printed sequences.

Sequence date for this patent did net form part of the printed sequences.

Sequence date for this patent did net form part of the printed sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein #1574 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single exon nucleic acid probes for analyzing gene expression in human hearts.
                            Claim 27; SEQ ID NO 11934; 327pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, gene expression, heart, microarray, vascular system;
cardiovascular disease, hypertension, cardiac arrhythmia,
comprises number of single exon nucleic acid probes.

                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; microarray; single exon probe; gene expression; breast; disease;

                                             measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                Gaps
                                  present invention relates to single exon nucleic acid probes for

                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in nolved in genetic liver diseases such as cirrhosis, hyperlippoproceinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG4734-ABG59930 represent human liver mingle exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at the whop.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to novel single exon nucleic acid probes (see AAIO0010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast diseases and non-carcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel single exon nucleic acid probe used to measuring gene expression in a human breast.
       Probe, human, breast disease, breast cancer, development disorder;
inflammatory disease, proliferative breast disease, non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human peptide encoded by genome-derived single exon probe SEQ ID 26617.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interatitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary hasmosiderosis; pulmonary histocytosis; Iymphangioleiomyomcosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasis; pulmonary hypertension;

```
present sequence is a peptide/protein encoded by a single exon probe of
the invention. Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic format
directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                              Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring the array with a carid expressed in the human lung; measuring the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contracting the array with a collection of detectably labeled nucleic acids derived from human lung array; identifying exons in a elwaryotic genome, comprising (a) adentifying exons in a elwaryotic genome, comprising (b) adetecting at least one exon from genomic osquences of the array is a fragment identical to the predicted exon, the probe is included in the above mentioned microarray sesigning exons to a single exon probe, and (b) measuring the expression of each of the exons in several crossing (a) identifying exons from genomic sequence by the method above mentioned microarray assigning exons to a single exon in the above mentioned microarray and/or call types using hybridisation to a single exon in croarrays having a probe with the exon, where a common pattern of expression of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression cancer, chronic obstructive pulmonary fibrosis, or encoded by the crome pattern of desesse (IDD), farming a language exon in a gene, particularly using human cuberous sclerosis, gaucher's disease, pulmonary disease (COPD), interstitial lung cancer, chronic obstructive pulmonary places, an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated polypeptide for treatment of diseases, diagnostics, raising antibodies and research use.

                                                                                                                            Homo sapiens.
                                                                                                                                                                    02-AUG-2001
                                                                                                                                                                                                                                                     Tang YT,
```

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies craised against the polypeptides, polynucleotides and antibodies are massed an amethod of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight expression or activity. The polypeptides can be used as molecular weight are used to identify compounds which bind to the polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of tecombinant proteins, and in generating anti-sense DNA or RNA and in generating plodies/elicit an immune response, to determine duantitative protein levels, as tissue markers, and to isolate receptors or ligands. Solypeptides of the invention may also be useful in treating platelet disorders, regenerating bourne, tendon, alignment and/or nerve tissue, wound healing, treating burne, promoting the proliferation, differentiation and survival of stem calls, as a manner and the proliferation and survival of stem calls. contraceptive, treating osteoporosis and osteoarthritis, anaemia, Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, graft-versus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system diseachers, and infection. The present sequence represents a protein of the invention

The invention relates to new isolated polynucleotides and polypeptides. The sequences, compositions and methods of the invantion are useful for diagnosimy, preventing or treating diseases involving aberrant protein expression or biological activity, such as cosquiation disorders (e.g. haemophilia), wounds, stroke, thrombosis, myocardial infarction, cancer, bone fractures, Alzheimer's disease, Parkinson's disease and autoimmune disorders. The polynucleotides may be used as hybridisation probes, as oligoners or primers, for polymerase chain reaction, for chromosome and gene mapping, in the recombinant production of proteins and in generation antibodies, as molecular weight markers or as food supplements. This sequence represents a human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides and polypeptides useful for diagnosing, preventing or treating diseases involving aberrant protein expression or activity, e.g. hemophilis, wounds, stroke, thrombosis, cancer or autoimmune disorders.
                                                                                                            Human, coagulation disorder, haemophilia, wound, stroke; thrombosis; myocardial infarction; cancer; bone fracture; Alzheimer's disease; barkinson's disease; autoimmune disorder; food supplement; haemostatic; vulnerary; cerebroprotective; thrombolytic; anticoagulant; cardiant; cytostatic; osteopathic; neuroprotective; nootropic; antiparkinsonian;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Qian XB, Wang ZW, Wehrman T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel human polynuclectide and the encoded polypeptide. A polynuclectide of the invention may have a use in gene therapy. An oligonuclectide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynuclectide or as a probe for detecting the polynuclectide. The polynuclectides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynuclectides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                          New polynucleotides and polypeptides are useful in gene therapy, developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the human Colorectal Lesion Associated 2 (CLA2) gene (1; ADO34038), which is located on chromosome 5p14. CLA2 sequences are useful for the detection and treatment of proliferative disorders such as: a benign and malignant tumour (head, neck, respiratory tract, gastrointestinal tract, skin and its appendages, central and peripheral nervous system, urinary system, reproductive system, endocrine system, soft tissues and bone, lymphopoietic and haematopoietic system, breast, anogenital or colorectal cancers), a carcinoma or a dysplasia. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated colorectal lesion associated nucleic acid molecule useful in the detection and therapy of proliferative disorders.
                                                                                                                                                                                                                                                                     Cytostatic; human; Colorectal Lesion Associated 2; CLA2; chromosome 5p14; proliferative disorder; tumour; cancer; carcinoma; dysplasia.

                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                              The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from MIPO at

The erbB receptor peptide antagonists are useful for perventing tumours and cancers (e.g. gastric cancer, breast cancer and prostate cancer). The present amino acid sequence represents a human erbB subdomain IV protein
                                                                                                                                                                                                The invention comprises the amino acid sequence of proteins from the hyperthermophile Methanopyrus kandleri, the invention also comprises the complete genome from Methanopyrus kandleri. The Methanopyrus kandleri aproteins of the invention are useful for enhancing the stability and/or activity of other proteins. The Methanopyrus kandleri genome is useful in a variety of diagnostic and analytical methods. The present amino acid sequence represents a Methanopyrus kandleri protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, vaccine, exbB receptor antagonist, tumour, cancer, gastric cancer,
breast cancer, prostate cancer, exbB receptor subdomain IV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide antagonists against erbB receptors, useful for preventing or treating tumors or cancers (e.g. lung adenocarcinomas, breast carcinomas or prostate cancer) in humans.
New isolated nucleic acids encoding any of about 1700 Methanopyrus kandleri proteins, and the encoded proteins, useful as a medicaments or as diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

1000.0
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                          ; Search time 41 Seconds

                                                                                                                                                                                                                                                                                                                                                                   GENERAL INFORMATION:
APPLICANT: Blaschuk, Orest W.
APPLICANT: Blaschuk, Orest W.
APPLICANT: GOUV. Barbara J.
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING TITLE OF INVENTION: CELL ADHESION
NUMBER OF SEQUENCES: 47
CORRESPONDENCE ADDRESS:
ADDRESSEE: SEED and BERRY LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
CITY: Seattle
STRAFE: Washington
COUNTRY: USA
ZIP: 98104
COUNTRY: USA
ZIP: 98104
COMPUTER: READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: BM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: BATCATION DATA:
APPLICATION NUMBER: US/08/893,534A
FILING DATE: 11-JUL-1997
CLASSIFICATION NUMBER: 330
ATTORNEY/AGENT INFORMATION:
NAME: MARAL, DAVIG J.
REFERENCE/DOCKET NUMBER: 100086.401
TELECOMMUNICATION INFORMATION:
TELEPHONE: (206) 622-4900
TELECOMMUNICATION NUMBER: 31,392
REFERENCE CHARACTERISTICS:
LENGTH: S maino acide
TVDF: Amino acide

INTERACTION BETWEEN ALPHA-CATENIN AND BETA-CATENIN
                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 8
US-09-458-870-10
i Sequence 10, Application US/09458870
j Patent No. 6465427
j GENERAL INFORMATION:
j APPLICANT: Blaschuk, Orest W.
j APPLICANT: Gour, Barbara J.
j APPLICANT: Ali, Anmar
j TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CELL ADHESION
j TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CELL ADHESION
j CURRENT APPLICATION NUMBER: US/09/458,870
j CURRENT APPLICATION NUMBER: US/09/458,870
j CURRENT PILING DATE: 1999-12-10
j SOFTWARE: Patentin Ver. 2.0
j SEQ ID NO 10
                                                                                                                                                                                                                                                                                     Gaps

Sequence 64 Application US/09458870

Jacent No. 6465427

GENERAL INFORMATION:

APPLICANT: Blaschuk, Orest W.

APPLICANT: Blaschuk, Riaz

TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CELL ADHESION

TITLE OF INVENTION COMPOUNDS.

CURRENT APPLICATION NUMBER: US/09/458,870

CURRENT APPLICATION NUMBER: US/09/458,870

WUMBER OF SEQ ID NOS: 101

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FEATURE:

OTHER INFORMATION: Cyclic Peptide may comprise N-terminal

OTHER INFORMATION: modification such as acetyl or alkoxybenzyl group

OTHER INFORMATION: and/or C-terminal modifications such as amide or

OTHER INFORMATION: ester group

ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Description of Artificial Sequence: Cyclic Peptide
OTHER INFORMATION: With Classical Cell Adhesion Recognition Sequence
OTHER INFORMATION: Cyclic Peptide may comprise N-terminal
OTHER INFORMATION: modification such as acetyl or alkoxybenzyl group
OTHER INFORMATION: ester group

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 88, Application US/09544782
; Sequence 88, Application US/09544782
; Patent No. 6610821
; GENERAL INFORMATION:
; APPLICANT: Blaschuk, Orest W.
; APPLICANT: Farookhi, Riaz
; APPLICANT: Ali, Annar
; TILLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CELL ADHESION
; FILE REFERENCE: 100086.401C9
; CURRENT APPLICATION NUMBER: US/09/544,782
; CURRENT FILING DATE: 2000-04-07
; NUMBER OF SEQ ID NOS: 96
; SOFTWARE: Patentin Ver. 2.0
; SEQ ID NO 88
LENGTH: 6

Sequence 96, Application US/09458870;
Sequence 96, Application US/09458870;
Patent No. 6458427;
GENERAL INFORMATION:
APPLICANT: Blaschuk, Orest W.
APPLICANT: Farockhi, Riaz
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CELL ADHESION
FILLE REFERENCE: 100086-401C8;
CURRENT APPLICANTON NUMBER: US/09/458,870
CURRENT APPLICATION NUMBER: US/09/458,870
CURRENT FILING DATE: 1999-12-10
NUMBER OF SEQ ID NOS: 101
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 96
LENGTH: 7
                                                                                                                                                                                                                                                                                                                                                  RESULT 33

OTHER INFORMATION: Description of Artificial Sequence: Cyclic Peptide
OTHER INFORMATION: with Classical Cell Adhesion Recognition Sequence
OTHER INFORMATION: Cyclic Peptide may comprise N-terminal
OTHER INFORMATION: modification such as acetyl or alkoxybenzyl group
OTHER INFORMATION: and/or C-terminal modifications such as amide or
OTHER INFORMATION: ester group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DEPLICANT: BLASCHWI, OTEST W.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 95, Application US/09458870

Sequence 95, Application US/09458870

Patent No. 6465427

GENERAL INFORMATION:
APPLICANT: Barbara J.
APPLICANT: Farockhi, Riaz
APPLICANT: Ali Anmar

TILLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CELL ADHESION
TILLE REFERENCE: 100086.401C8
CURRENT APPLICATION NUMBER: US/09/458,870
CURRENT PILLING DATE: 1999-12-10
NUMBER OF SEQ ID NOS: 101
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 95
LINGTH: 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      APPLICANT: Blaschuk, Orest W.

GENERAL INPORMATION:
APPLICANT: SMITH, DOUGLAS
APPLICANT: MAO, JEN-I
APPLICANT: MAO, JEN-I
TITLE OF INVENTION: NUCLBIC ACID AND AMINO ACID SEQUENCES
TITLE OF INVENTION: NUCLBIC ACID AND THERAPEUTICS
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
NUMBER OF SEQUENCES: 411
CORRESPONDENCE ADDRESS:
ADDRESSEE: WOLF, GREENFIELD & SACKS, P.C.
CURRENT APPLICATION NUMBER: US/09/544,782

CURRENT FILING DATE: 2000-04-07

NUMBER OF SEQ ID NOS: 96

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 95

LENGTH: 8

TYPE: PRT

ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Description of Artificial Sequence: Cyclic Peptide
OTHER INFORMATION: with Classical Cell Adhesion Recognition Sequence
OTHER INFORMATION: with Classical Cell Adhesion Recognition Sequence
OTHER INFORMATION: madification such as acetyl or alkoxybenzyl group
OTHER INFORMATION: ester group

| GENERAL INFORMATION:
| APPLICANT: Blaschuk, Orest W. APPLICANT: Gour, Barbara J. TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING TITLE OF INVENTION: CELL ADHESION NUMBER OF SEQUENCES: 47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          selectable cell surface marker genes
          CURRENT APPLICATION DATA:

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/475,035

FILING DATE: 7 Jun 1995

CLASSIFCATION: 435

ATTORNEY/AGENT INFORMATION:

NAME: PERTYMAN, David G.

REGISTRATION NUMBER: 33 438

REGISTRATION NUMBER: 33 438

RETERENCE/DOCKET NUMBER: 1414.656

TELEPHONE: 404/688-9880

INFORMATION FOR SEQ ID NO: 4:

SEQUENCE CHARACTERISTICS:

LENGTH: 1210 amino acid

TYPE: amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                        . 1.3e+03;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US-09-250-059-11

US-09-250-059-11

Sequence 11, Application US/09250059

Patent No. 6333307

GENERAL INFORMATION:

APPLICANT: Blaschuk, Orest W.

APPLICANT: Gour, Barbara J.

TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING NEURITE OUTGROWTH
FILLE REPRENCE: 100066-401C6

CURRENT APPLICATION NUMBER: US/09/250,059

CURRENT PILING DATE: 1999-02-12

NUMBER OF SEQ ID NOS: 87

SEQ ID NO 11

LENGTH: 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                OTHER INFORMATION: Cyclic Peptide may comprise N-terminal OTHER INFORMATION: modification such as acetyl or alkoxybenzyl group OTHER INFORMATION: and/or C-terminal modifications such as amide or OTHER INFORMATION: ester group

CRGANISM: Artificial Sequence
FEATURE:
CHER INFORMATION: Description of Artificial Sequence: Cyclic
OTHER INFORMATION: Control peptide
OTHER INFORMATION: Cyclic Peptide may comprise N-terminal
OTHER INFORMATION: modification such as acetyl or alkoxybenzyl group
OTHER INFORMATION: and/or C-terminal modifications such as amide or
CHER INFORMATION: ester group

Pypothetical protein T17J13.120 - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Decies: Arabidopsis thaliana (mouse-ear cress)
C;Accession: T48008
B;Rieger, M.; Mueller-Auer, S.; Zipp, M.; Schaefer, M.; Mewes, H.W.; Lemcke, K.; Mayer, Psubmitted to the Protein Sequence Database, February 2000
